

Step 1: Prepare Your Files

1. Copy the files of your Product Details Page project.
2. Create a new folder.
3. Paste the files of your project in the new folder
4. Open your new folder in Cursor
5. Create a new file named:
[js.md](#)
6. Create a new file named:
[script.js](#)

Step 2: Write your plan

Copy the following reflection questions into [js.md](#).

For each behavior, answer the questions in order:

1. What do you want the page to do?
2. What user action triggers it?
3. What will change on the screen?
4. What are the steps to reach the output?

Step 3: Understand Requirements

You need to add the following behaviors to your Copy of Product Details Page:

1. CTA Button
 - The button text changes after the user clicks it.
2. FAQ or Features Section
 - The section shows and hides.

3. Light & Dark Mode Button

- A new button that changes:
 - The background color of the webpage
 - The text color of the webpage.

Follow the Rules Before Coding

- Do not start prompting immediately.
- You must explain each behavior in words first.
- Type the answers of the questions for all behaviors you will add in [js.md](#) file.

Step 4: Prompt the JavaScript Code

- Add all JavaScript code to the **script.js** file.
 - Connect the JavaScript file correctly to the HTML file
 - Add all of your prompts to [js.md](#) file
-

Step 5: Submit Your Work

1. Check your project.
2. Create a new GitHub repository.
3. Name the repository: **Javascript**
4. Upload the code to your new repo
5. Deploy your project using github pages
6. Submit your github repo link AND your deployment link in the correct thread on discord - tasks channel
